About the task

To develop a Python program for selecting the minimum set of artificial light sources, whose combined spectrum reproduces the reference solar spectrum (AM1.5G) as accurately as possible with an acceptable deviation of $<15\%$ in total at all wavelengths.

Stack

Implemented in python

scipy – used for non-negative least squares optimization (nnls) to find the optimal coefficients for combining light source spectra in order to approximate the target solar spectrum

numpy – used for numerical computations, including array operations, generating synthetic spectra using Gaussian distributions, adding noise, and performing interpolation and normalization of spectral data

pandas – used for loading, processing, and manipulating spectral data in tabular format, including reading CSV files, handling wavelengths and intensities, and organizing results

optimizer.py

optimizer.py > SpectrumOptimizer > _init_

```
1 import numpy as np
2 import pandas as pd
3 from scipy.optimize import nnls
4 from tqdm import tqdm
5
6 class SpectrumOptimizer:
7     def __init__(self, target_spectrum, sources, wavelength_range=(380, 1100), max_sources=10, tolerance=0.15):
8         """
9         Основной класс для подбора минимального набора источников света,
10         чей комбинированный спектр воспроизводит эталонный спектр AM1.5G
11         """
12         # Фильтруем эталонный спектр по диапазону
13         self.target_spectrum = target_spectrum[
14             (target_spectrum["Wavelength"] >= wavelength_range[0]) &
15             (target_spectrum["Wavelength"] <= wavelength_range[1])
16         ].reset_index(drop=True)
17
18         self.sources = sources
19         self.max_sources = max_sources
20         self.tolerance = tolerance
21         self.target_wavelengths = self.target_spectrum["Wavelength"].values
22         self.target_values = self.target_spectrum["Spectral_irradiance"].values
23
24         # Нормализуем эталонный спектр для согласованности масштабов
25         self.target_max = self.target_values.max()
26         self.target_values_normalized = self.target_values / self.target_max
27
28         print(f"📊 Эталонный спектр: мин={self.target_values.min():.4f}, макс={self.target_values.max():.4f}")
29         print(f"📊 После нормализации: мин={self.target_values_normalized.min():.4f}, макс={self.target_values_normalized.max():.4f}")
```

Key steps:

1. **Normalization:** Both the target and source spectra are normalized to ensure consistent scaling.
2. **Correlation ranking:** Light sources are ranked based on their correlation with the target spectrum.
3. **Iterative selection:** At each step, one source is added to the combination, and NNLS is used to compute optimal non-negative coefficients that minimize the spectral error.
4. **Error evaluation:** The relative error between the combined and target spectrum is computed, and the process stops if the error falls below a given tolerance threshold or the max number of sources is reached.

Goal : Minimize the number of light sources while achieving an acceptable match to the target spectrum.

generate.py

```
92 def gaussian(x, mu, sigma, amp=1.0):
93     """Гауссово распределение для моделирования спектра"""
94     return amp * np.exp(-((x - mu) ** 2) / (2 * sigma ** 2))
95
96 def generate_led_spectrum(peak, sigma, amp, name):
97     """Генерация синтетического спектра с шумом и нормализацией"""
98     intensity = gaussian(WAVELENGTH_RANGE, peak, sigma, amp)
99     intensity = np.clip(intensity, 0, None)
100
101 def main():
102     print(f"Генерация спектров для {len(LED_TYPES)} источников...")
103     for led in LED_TYPES:
104         generate_led_spectrum(
105             peak=led["peak"],
106             sigma=led["sigma"],
107             amp=led["amp"],
108             name=led["name"]
109         )
```

The algorithm selects the minimum number of light sources whose spectra, combined with non-negative coefficients (found through NNLS), most accurately reproduce the reference solar spectrum of AM1.5G with a given accuracy.

Result

- Average error: 0.1313 (13%)
- Maximum error: 2.7820 (278%)
- Number of sources: 61
